PROJECTS

Cardle
- Cardle is a wordle spinoff, for car enthusiasts. This was a personal project to refine and show off my designing and MERN stack skills. The backend consists of an Express server that handles all guesses, stats, and answers. MongoDB is used to store users' cookies, and guesses. The frontend was designed with Figma, and was developed using React.

Spotify App
- This app is another personal project created to display my experience working with APIs, as well as learning Material UI. The backend was made with an Express server that handles spotify's login callbacks. The frontend was developed with React, Material UI, and using Spotify's Web API to fetch a user's Spotify stats.

Spoof Tool
- The Spoof Tool was an app created to spoof an iDevice's location to help secure limited sneakers. This project was created for a client early on in my freelancing career. The frontend was designed by another freelancer, and developed by myself using React, Google Maps API, and Mapbox. The backend uses Electron, and iFakeLocation. I feel this project displays a variety in my projects, and my ability to collaborate, and work with others.

Proxy Gen App
- This Proxy Gen App was another app created for one of my clients. They wanted an app to create web proxies with cloud services such as Google, AWS, and others. It allows the user to save their info from a cloud service to the app, and create any number of proxies with a click of a button. The frontend design was provided by the client, and was developed by me using React. The backend was developed using Electron, Google Cloud API, AWS SDK. This project showcases my ability to work with API's, and SDKs from a variety of different services, and create complex apps.

WORK EXPERIENCE

Darling Inc.   **Dec. 2020 – July 2021**
Full Stack Web Developer   *Remote*
- Darling is a company focused on assisting with securing limited collectibles.
- I was hired to assist with developing an application. My first responsibility was to completely refactor their current app to incorporate new branding, and allow for better performance and scaling.
- I also was in charge of taking in community requests, and communicating the request with our team, and implementing it into the app

SKILLS & INTERESTS

- **Skills:**
    - **Languages:** HTML; CSS; JavaScript
    - **Tools:** Nodejs; React; Electron; Express; MongoDB; Git
    - **Other:** Figma; Heroku; Postman
- **Interests:** Music; festivals; fitness; nature; cars; sneakers; technology; gaming; sports; movies
